GEOMETRICAL STRUCTURE OF LOCAL BOOSTING

MASANORI KAWAKITA

Department of Statistical Science in the Graduate University of Advanced Studies

A geometrical structure of local boosting are studied. Kawakita and Eguchi (In prep.) proposed the local boosting method, which is derived by introducing kernellocalization in the sligtly different way from the conventional local likelihood approach. We derive the pair (metric, dual connections) from the divergence associated with local boosting and compare it with ordinary boosting.
